MHP has converted a relationship-driven export business into a digitally enabled customer ecosystem where product discovery, onboarding, shipment visibility, financial transparency and service support are largely self-managed by the customer.

For poultry and retail this is probably where the industry is heading over the next 5 years.

From the user manual and portal structure, MHP appears to have built a mature B2B customer self-service platform rather than a simple order booking system.

The portal combines six important functions into one customer interface:

1. Customer onboarding
2. Product discovery
3. Customized product development
4. Shipment tracking
5. Financial transparency
6. Customer service and claims management

This means the customer depends less on sales executives for routine activities.

1. Customer Onboarding

Customers receive login credentials, create their own password, create additional users, and assign permissions internally.

This is quite advanced because MHP effectively allows:

- Buyer
- Procurement manager
- Finance team
- Logistics team
- QA team

to all access the same account with different permissions. For a large customer such as Lulu, Carrefour or a distributor, this is extremely useful.

Relevance to Allana

For buffalo exports this may not add huge value immediately because relationships remain highly personal. For IRAPL and retail distribution, however, this could become very valuable.

2. Product Catalog

This is probably the most interesting feature. Customers can:

- search products
- filter by category
- filter by packaging type
- filter by frozen format
- browse brands
- view packaging examples
- view technical specifications and storage conditions.

Effectively this becomes a digital sales brochure. Instead of: "Please send product catalogue", the customer already has everything online.

For Allana this could become:

Buffalo

- Silverside
- Topside
- Shin shank
- Trimmings
- Offals
- VPCM products

with:

- specification sheets
- carton dimensions
- loading pattern
- shelf life
- certifications

Sheep and Goat

This becomes even more useful because SKU complexity is much higher.

3. Customized Product Requests

Customers can submit requests for:

- new cuts
- new packaging
- new recipes
- new specifications

and then track progress through statuses; In Review, Analysis, Accepted, Declined.

This effectively digitizes interaction between:
Customer → Sales → R&D → Production → Customer

For example: Need 450g vacuum packed goat cubes for UAE retail.

Instead of endless emails, the customer simply submits the request. This is extremely useful for RTC/RTE and retail businesses.

4. Shipment Tracking

This is where MHP seems very strong. Customers can see:

- order number
- shipment quantity
- shipment value
- shipment status
- ETD
- ETA
- container number
- shipping line
- destination port.

This removes a huge amount of email traffic. Typical export conversations become unnecessary:

- Container shipped?
- Vessel name?
- ETA?
- Documents sent?
- Has container arrived?

5. Financial Dashboard

This is something meat exporters almost never provide. Customers can see:

- credit limit
- receivables
- overdue receivables
- available limit.

For distributors this is extremely valuable.

Example:

- Credit Limit: $2 million
- Outstanding: $1.2 million
- Available: $800,000

Customer immediately knows whether additional orders can be placed.

6. Claims and Service

Notifications include:

- shipment arrival alerts
- custom product status
- claim updates
- license expiry alerts.

This converts the portal into a customer service desk rather than merely an ordering tool.

Assessment

This is not an ecommerce platform.

It is closer to:

SAP Customer Portal + CRM + Shipment Tracker + Product Catalog + Service Desk

Would this work for Allana?

Immediate value:

- Shipment tracking
- Document repository
- Product catalogue
- Customer notifications

Medium-term value:

- Claims portal
- Credit dashboard
- Customer onboarding

Long-term value:

- Online ordering
- Forecast sharing
- Retail replenishment planning
